

ABSTRACT OF THE DISCLOSURE

An operation mode control program is a program
for carrying out an operation mode changeover control.
A user interface section sets time zone corresponding
5 to each operation mode. A time acquire section
periodically acquires system time from an internal
clock section of an operating system, and transfers the
system time to an operation mode changeover section.
The operation mode changeover section carries out the
10 operation mode changeover control in accordance with
time zone set by the user interface section while
receiving the system time from the time acquire
section.
